Grade Level: Third Grade

Time: 60 minutes plus an addition 60 minutes for the ball to set in a refrigerator.

Brief Description of Lesson: Oh, no! Gaby and Rory have no ping pong ball to play with! In this fun, 60-minute lesson, students will be introduced to the Engineering Design Process and be guided through the process of developing, measuring, and possibly revising a solution.

FIU-EOW offers ways to differentiate to provide opportunities for all students to access the curriculum or standards. These are being provided as suggestions.

solution until you reach your desired consistency.

-Remove the slime from the bowl and roll it into a ball. The more you roll it, the less slimy it will become. It will continue to harden but will still be squishable.

-Place the ball into the refrigerator for 1 hour before bouncing!

The more you knead and play with your slime, the firmer and less sticky it will become!

suddenly realized that the ping pong ball had gone MISSING! They have tried to use marble, a tennis ball, and a baseball, but none worked! They need your help! The average height ping pong ball can bounce is 40mm. The bouncing size required by federation standards is at least 23 cm for free-falling table ping pong balls from 30 cm.

Problem: How can we create a ball that meets the Ping Pong Ball Federations standards?

Measurable Goal: Students will determine if they are successful if the ball can bounce a minimum of 23 cm when released at the height of 30 cm.

Differentiation:

Students may have tactile sensory challenges, and it may be best to provide <u>plastic gloves</u> when holding and forming the ball or during the entire experiment, along with <u>noise-canceling headphones</u> because the classroom environment may get loud due to excitement.

Differentiation:

Students should be given the opportunity to include a description through a voice note or visual representation when they upload their video, description, and supporting data. This accommodation will elevate any challenges around writing or spelling.

Differentiation:

When students are creating, they should be allowed to reference or look at a ruler to use as a visual reference to better understand the height their ball must reach.

*It's important to remember that timed activities can cause a lot of anxiety to students. Please provide a visual clock and remind students how much time they have left in 10-minute increments. *

Differentiated Planning Pages:

<u>Planning Page!</u> <u>Planning Page@</u>

Differentiation:

Students will be given the makeit-and-test-it worksheet that best suits their learning needs.

Differentiated Data Records Worksheets:
